# Mobile Back Office

Simplify and streamline the stock–handling process

Priority Mobile Back Office is a dedicated, simple-to-use mobile application specifically designed for storekeepers and staff. The application allows them to easily receive and release stock items to/from anywhere within the store on-the-go, regardless of the store's cash register location.

The Priority Mobile Back Office application allows retailers to streamline and simplify their stock handling processes, from keeping their store floors appealing to customers and improving the business's overall operational efficiency, to eliminating paperwork, reducing errors, and ensuring reliable inventory and stock reporting.

**Easily receive and release stock items from anywhere within your store**

No more scattered packages on the store floor during working hours

Efficiently perform physical inventory and item availability inquiries

# The Priority Mobile Back Office application provides advanced stock handling capabilities:

Stock transfers between warehouses and stores

- Receive stock items that arrived in the store from a supplier and/or between stores
- Receive items anywhere in your store by easily scanning their barcodes
- Compare received items to the courier's shipping certificate and/or the purchase order
- Accept returned items

Release of stock items/goods

- Allows easy transfer of goods from the store or warehouse to another store
- Automatic scanning and recording of out items

Stocktaking – Easily accomplish stocktaking using powerful barcode scanning capabilities and stores

Item availability inquiry – Scan a barcode to view its availability across all chain stores

- The application can either be installed on a dedicated handheld device that serves as a mobile POS or on any iOS or Android mobile device with scanning capabilities.

- As soon as goods are scanned, the system updates the inventory in real time.

- In both options, the application uses cellular communications to communicate with the back-office and does not require the deployment of a wireless network in the store.

Transit Warehouse

The mobile back office application also supports 'Transit Warehouse', where the courier vehicle transferring goods is regarded as an intermediate warehouse that receives the goods from one store and moves it to another. This allows ease of tracing back missing items lost during the transfer process.
